

Industrial decontamination

Powered by our owned patented technology, **“No Man Entry™”** is our overriding philosophy and approach for the assurance of operational safety in industrial decontamination.

Above
Camaleonte, “No Man Entry™” technology.

Most of our success is built on continuous communication between on-site staff and our R&D, the latter source of leading-edge, customised services and technologies.

Industrial sites activities

- > decontamination of fuel storage tanks
- > decontamination and rehabilitation of Jet Fuel storage tanks, according to the most stringent international regulations
- > decontamination of refinery storage tanks (using Cow System technology)
- > integrity test of oil and underground pipelines
- > cleaning, video-inspection and remediation of underground pipelines (using No-Dig techniques)
- > rehabilitation of underground fuel, water, sewage pipelines, etc. (using Cipp Relining technology)
- > quality test and structural material control in plants and tanks
- > rehabilitation of vats and underground tanks
- > monitoring and decontamination of confined, toxic and explosive environments (using Super Bruco and Pavone technologies)

Diagnostics and maintenance of underground tanks and pipelines

- > cleaning and decontamination of tanks (using Bruco and Super Bruco technologies)
- > leakage test (using Polifemo system and SDT technologies)
- > thickness measurement (using Camaleonte and Ragno technologies)
- > tank calibration (through certified methodology)
- > relining and tanks transformation from single to double wall type (using T12/doublewall system)
- > filtration (using Mini cau system)
- > tank inactivation (using low-density foams)
- > treatments of tank walls (using Pavone technology)
- > cleaning and rehabilitation of manhole pits
- > volume reduction and requalification of underground tanks

Industrial decontamination
